

Gal Tidhar

SENIOR FULL STACK ENGINEER

gal@tidhar.org.il +385 99 190 4995 linkedin.com/in/galtidhar github.com/tatarco

Zagreb, Croatia

PROFILE

Full Stack Engineer with 7+ years across the entire stack, backend-oriented with solid, production-proven frontend experience in React and TypeScript. Strong track record designing and delivering admin and back-office applications, event-driven microservices, and scalable APIs. Comfortable owning features from database to UI in fast-moving startup environments.

EXPERIENCE

Jun 2025
Present

Sedric.ai

Senior Software Engineer · Remote

- Designed and built a full-stack internal developer data platform from scratch — a back-office tool consolidating data from multiple clouds and databases (AWS, MongoDB Atlas) into a unified React + TypeScript UI. Enabled CSM and engineering teams to independently investigate and resolve production issues, significantly reducing engineering overhead.
- Drove organization-wide adoption of AI-assisted development using Claude Code as the primary delivery engine: building and refactoring UIs, overhauling CI pipelines, and consistently shipping polished, KISS-principled developer tooling. Ran hands-on workshops that measurably improved engineering velocity.
- Overhauled developer experience across all organization repositories — designing KISS-first local dev environments that eliminated dependency on remote deployments for testing. Reduced friction to near-zero for onboarding and daily development cycles, increasing team velocity by 24%.

Novu.co OpenSource
Senior Software Engineer · Remote

- Achieved 78% reduction in build time by consolidating community-driven modules into a single optimized master module with advanced tree shaking.
- Built CLI code generators for new notification channels, significantly accelerating open-source community contributions.
- Integrated the public OpenAPI specification into the CI/CD pipeline, ensuring seamless deployment and automated contract validation.
- Redesigned the API architecture for the Novu V2 framework, establishing a CMS-like pipeline management system.

Shopify via Flexport
Staff Software Engineer · Remote

- Reduced operational delays by 70% on average by building a Conversational Bot exposing functionality unavailable in traditional Warehouse Management Systems.
- Led implementation of a shipment event mechanism and audit log, directly contributing to improving the On-Time-Shipping OKR to 97%.
- Owned cross-team integration design, enforcing decoupling that increased feature velocity and reduced maintenance overhead across groups.
- Designed and built freight consolidation logic, eliminating a 3-hour manual overhead from each inventory transfer block.

Deliverr acq. Shopify
Senior Software Engineer

- Led design and delivery of the new B2B product line from 0 to 1.
- Drove org-wide adoption of auto-generated OpenAPI contracts — within 6 months, 8 teams and 14 microservices migrated, reducing API development overhead by 90%.
- Built back-office systems to augment warehouse management workflows — centered around an internally developed chatbot with an extensible command architecture — reducing error rates from 30% to near-zero.

Wochit

Senior Backend Developer · Tel Aviv

- Designed and built a new back-office admin system using Vaadin — empowering backend engineers to deliver full-stack features without frontend specialists — reducing time-to-ship by 80%. Fully replaced the legacy system, adopted across all CSM workflows on day one.
- Led a live Elasticsearch migration from self-managed v2.7 to hosted v8 with zero downtime — 46% cost reduction and 99% reduction in maintenance downtime.
- Initiated E2E testing practice, mentoring an automation developer and cutting release turnaround by 50%.
- Automated release preparation by parsing GitHub commits and generating deployment procedures — saving 10 engineering hours per week.
